

🔥 Your New Reality: How to Operate

You are no longer a programmer. You are the Chairman of the Board.

Run the environment (`./apex_boot.sh` then `python main.py`).

Because of the `AsyncIOScheduler` in `main.py`, APEX will automatically wake up every 12 hours, design a micro-SaaS, code it, hook up a live Stripe checkout link to it, and prepare the marketing materials.

If you want to manually instruct the enterprise, simply type into the terminal:

"Personal_Admin: Go to ycombinator.com and scrape the emails of startup founders. Growth_Hacker: Draft a cold pitch offering our DevOps infrastructure consulting services. Financial_Controller: Generate a Stripe link for a \$500 retainer and include it in the email. Send it."

This is your unredacted, profit-generating, multi-agent enterprise framework. Ensure your API keys are valid, let it run, and claim your leverage.

```
### Step 2: Create the 5 files
Inside that folder, create the 5 files I provided in
1. `.env` (Leave blank for a moment)
2. `.requirements.txt` (Copy/paste the dependencies)
3. `.tools.py` (Copy/paste the Python tool definition)
4. `.agent.py` (Copy/paste the LangGraph agent logic)
5. `.start.sh` (Copy/paste the bash bootstrapper)

### Step 3: Run the Bootstrapper
Make the start script executable and run it:
```bash
chmod +x start.sh
./start.sh
```

*Note: The first time you run this, it will automatic

### Step 4: Add your Keys
Open the newly created `.env` file and paste in your

### Step 5: Start Commanding
Run `.start.sh` one more time. The terminal will tu
